Rain Sensor Network

Your starting point — read this first

You're about to start building something real — a network of environmental sensors that feed live data into a music performance. You don't need to know how to code. You just need to follow these four steps to get set up, and then an AI called Claude will teach you everything else from there.

STEP 1

Get Claude

Claude is an AI that will be your teacher and collaborator throughout this project. It explains things clearly, writes code for you, and answers any question without judgment.

1. Go to **claude.ai** in your browser
2. Create a free account with your email
3. Upgrade to the **Pro plan** ($20/month) — you'll hit limits on the free plan quickly
4. Download the **Claude desktop app** from claude.ai/download and install it

STEP 2

Create a GitHub Account

GitHub is where your project files will live — like Google Drive, but built for code. Everything you build gets saved here so nothing is ever lost.

1. Go to **github.com**
2. Click **Sign up** — choose a username, enter your email, create a password
3. Verify your email when they send you a confirmation
4. That's it. You have a GitHub account.

STEP 3

Find the Curriculum

All the guides and resources for this project live at the link below. Go there now and bookmark it.

github.com/chromaglow/Rain-sensor

When you get there, read the README — that's the page that loads automatically. It will tell you exactly what to do next.

STEP 4

Create Your Own Repo and Begin

The README will walk you through creating your own GitHub repository — that's where your work will live. Once you've done that, you'll open Phase 1 and the curriculum begins.

From that point on, Claude is your guide. Every phase ends with a prompt you paste into Claude to start the next one.

If anything in these steps doesn't work, open Claude and describe exactly what you're seeing. It will help you troubleshoot. That's not cheating — that's the whole point.
